Tactical Chemical Exposure & Operational Matrix

Reference Protocol: PREPARAAT I, II, III — Tactical Identity & Biomechanical Performance System

Operational Status: Formalized System Directive for Sensory Optimization

1. Molecular Profiles & Safety Data (Exposure Limits)

The following dataset establishes the baseline physical-chemical parameters and safety profiles for volatile organic compounds used in environmental sensory modifications.

Compound / CAS	Molecular Class	Boiling Point	Target Receptors	Exposure Guidelines / Safety
L-Menthol 2216-51-5	Monocyclic Monoterpenol	212 °C	TRPM8 (Cold Menthol Receptor 1)	Low toxicity. Avoid direct ocular or concentrated mucosal splash. Clear clearance protocols.
Alpha-Pinene 80-56-8	Bicyclic Monoterpene	156 °C	AChE Inhibitor / Capillary Transfer	Flammable liquid/vapor. Skin sensitizer. Use in well-ventilated operational spaces.
Hedione 24851-98-7	Cyclopentanone Ester	302 °C	VN1R Vomeronasal Type 1	Extremely high safety threshold. Readily biodegradable. Non-irritant at working dilutions.

2. Tactical Deployment Schedule for Operational Shifts

Operational scheduling designed to leverage chemical volatility windows and physiological circadian baselines for maximum spatial awareness and fatigue mitigation.

Phase / Timing	Target Vector	Deployment Modality	Expected Neurological Shift
Phase I: Priming (T-05 Min Pre-Shift)	Alpine-Mineral (Victorinox Profile)	Topical application to carotid pulse zones (bilateral neck).	Stabilizes nervous system; attenuates initial stress/cortisol spikes via GABA pathways.
Phase II: Tracking (Sustained Maneuvers)	High-Altitude Ozonic (Aeronautica Profile)	Ambient aerosolization within vehicle cabin or console grid.	Hypothalamic activation; maintains focus baselines, pattern recognition, and target vigilance.
Phase III: Override (Extended Windows)	Earthy Fougère (US Army Profile)	Friction application to wrist cuffs or uniform collar points.	Natural acetylcholinesterase inhibition; delays physical and mental exhaustion cycles.

3. Regulatory & Clinical Safety Directives

All applications must run concurrently with local civilian traffic frameworks (such as the Dutch RVV 1990 updates regarding official military convoy markers). Do not compromise primary physical visual identifiers (such as blue/green flags) in favor of internal sensory optimization strategies.
